Start run

First run downloads the Adult dataset (~3-4 MB) from OpenML and caches it to data/adult.npz — later runs reuse the cache.

Adult Income — Measuring and Mitigating Sex Bias

The question: a classifier trained to predict income (>$50K/year) from the UCI Adult census data learns to flag qualified women as high earners far less often than equally qualified men. This dashboard trains that classifier under three settings — no correction, oversampling, and reweighting (see `bias_mitigation.py`) — and measures whether each one actually closes the gap, and what (if anything) it costs in accuracy.
